

## C.I.Agent® Geomembrane Liner System with Oil Filtration Panels

Looking for a passive, self-activating secondary oil containment system ideal for all subsoils? Look no further. The C.I.Agent® Geomembrane Liner System with Oil Filtration Panels is capable of not only filtering water at high flow rates, but simultaneously blocking the passage of hydrocarbons. The Geomembrane Liner covers the floor of the containment area, protecting the subsoil from any hydrocarbons leaching out. Composed of non-woven geotextile and patented C.I.Agent® Agent-Q (US Patent 8,986,822) filtration media, the Oil Filtration Panels utilize C.I.Agent® polymers to solidify and shut off in the event of a release, preventing hydrocarbons from escaping the containment site. The system meets or exceeds SPCC requirements 40 CFR 112.7; U.S.D.A. Bulletin 1724E-302, Chapter 3-3.2.2 and 3.2.3; and IEEE Std. 980, and is covered by a Product Liability and Pollution Insurance Policy of up to \$7 million\*.

A bury and forget application, all C.I.Agent® Geomembrane Liner Solutions are custom manufactured to meet customer engineered specifications.

### Features and Benefits

- Impervious subsurface (Clay)
- Permeable subsurface (Sandy or undetermined subsoil)
- Near navigable water
- Can support vehicle traffic/heavy loads
- Fits within space constraints of each site
- No depth restrictions
- No temperature constraints
- Insurance policy
- Below-grade containment
- Above-grade containment
- Fire suppression/Fire resistant capabilities
- Supports redundancy
- Supports high flow rates at low head pressure
- Aesthetically pleasing
- Passive containment
- Minimal maintenance
- Easy installation (1 to 2 days)
- Can solidify all types of hydrocarbons (including FR3)
